

HIGHLIGHTED EXPERIENCE

Senior Software Engineer, **BCG - X**, Enterprise business development

Jan '26 - June '26

- Curated personalised business intelligence for senior leadership based on their clientele, practice areas, and preferences by leading engineering of an AI-enabled web platform powered by Celery, frontier models on AWS Bedrock, and Exa.
- Developed and owned the email digest pipeline end-to-end which had ~92% open rate and went on to become leadership's primary engagement surface, surpassing the web platform. The digests consolidated analysis of earnings releases, industry news, C-level executives' buying interest and others from 11 AI agents.
- Saved ~12% on LLM spends by cutting ~35% signal volume with a semantic clustering pipeline built using Amazon Titan v2 embeddings and RDS/pgvector.
- Unblocked production launch by building the AI safety layer using Bedrock Guardrails, authoring audit logging, and patching vulnerabilities from Veracode SAST/SCA, Acunetix360 DAST, an external pentest, and Prisma image scans.
- Served as the primary PoC across product, infra, security, DPO, RAI, legal, identity, and other teams to unblock my team and clear release gates.
- Set precedents on Celery worker deployments, guardrail specification, and automated user management with Okta Core API for sibling engineering teams to follow.

Software Engineer, **Portal**, Web3 infrastructure

May '24 - June '25

- Curtailed manual plan enforcement work for BizOps/Sales and resource abuse incidents by implementing subscription tiering in a Node/TS backend and Redis-powered usage capping as key milestones toward a fully self-serve platform.
- Brought down processing times by ~98% for the asset insights pipeline by shifting to BigQuery. The pipeline calculated daily volume and EOD token balances for >10M ever-growing SECP256K1 and ED25519 wallets.
- Accelerated enterprise adoption by integrating TOTP-based MFA, SSO, user impersonation, and various other, highly requested, enterprise auth features in the TS/Next frontend with Stych.
- Improved platform security posture ahead of enterprise onboarding by triaging and often fixing >\$15K worth of validated vulnerabilities reported via Bugcrowd.

Founding Software Engineer, **Safe Sign**, Consumer services

Mar '23 - Nov '23

- Led development of AI-enabled UK-only products from the ground up that recommended energy and broadband providers to users. Users could also formally initiate switching to these providers.
- Implemented the core LLM pipeline, resembling RAG, that allowed users to type in their expectations from a provider or the issues they faced with their current provider, which would then be passed through an LLM (GPT 3.5 or 4) and mapped to the switchable providers supported.

Software Engineer, **smallcase**, Fintech

June '19 - June '21

- Owned the communications and analytics infrastructure which primarily involved integrating B2B APIs in Node/JS applications, working on systems that ingest data at scale, and maintaining databases that enabled analysis and insight.
- Built a custom, Kafka and Redis based, distributed bucketing & throttling pipeline that reduced internal systems' load metrics by as much as 98% and SLA-based errors from external entities by 70%. This is still in production.
- Integrated WhatsApp messaging in the product ecosystem - 26% of the nudges sent to users in the first year led to a transactional action.

EDUCATION

SKIT Jaipur, B.Tech. - Computer Science

Aug '15 - May '19
